1. INTRODUCTION

This manual describes the operating features and safety equipment of the New Flyer transit vehicle. All personnel involved in the operation of the vehicle should be acquainted with this manual and should familiarize themselves with the vehicle, before providing any public service. Knowing the contents of this booklet and following its recommendations will help to assure safe and trouble-free operation.

It is not the intention or responsibility of this manual to give instruction in the use of common sense, basic skills and rules of driving; therefore, it is assumed that you, the operator, are fully qualified to operate a public transit vehicle.

This manual and any other supplied should be considered a permanent part of the vehicle and remain with the vehicle at all times. The information and specifications throughout this manual are up to date at time of publication. New Flyer reserves the right to change the content of this manual at any time without notice. Any malfunction which interferes with the safe operation of the vehicle should be reported immediately to the appropriate service personnel.

**NOTE:**

*New Flyer urges you the driver to read this publication carefully, as well as the following manuals which are readily available from the respective manufacturer.*

- *Allison Transmission B400R Operator’s Manual*
- *Cummins ISL9L (EPA 2010) Series Engine Owner’s Manual*
Vehicle Patent Information

This New Flyer product and its components, and methods of manufacturing thereof, may be protected by one or more of the following patents and patent applications. In addition, such products, components, and/or methods may be protected by one or more patent and design applications which may have not been published as of the date of this manual, in the United States, Canada, and elsewhere. Please direct all inquiries to our Corporate offices. For a current listing of applicable patents, please refer to our Legal Notice at our corporate website, http://www.newflyer.com.

In the United States: patents and applications 5,391,041; 6,257,652; 6,340,202; 6,343,908; 6,375,249; 6,397,965; 6,416,116; 6,556,899; 6,611,739; 6,681,174; 6,726,271; Appls. Ser. No. 2009/0313904; 2009/0195015.

Vehicle Identification

The New Flyer vehicle identification plate is located in the driver’s area of the vehicle interior. The plate lists the Gross Vehicle Weight Ratings (GVWR), the Vehicle Identification Number (VIN) and the Gross Axle Weight Ratings (GAWR) for all axles.
Danger, Warning, Caution & Note

Four types of headings are used in this guide to attract your attention. These notations will be highlighted with the icons below.

⚠️ **DANGER**

Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

⚠️ **WARNING**

Used when an operating procedure or practice, if not correctly followed, could result in personal injury or loss of life.

⚠️ **CAUTION**

Used when an operating procedure or practice, if not strictly observed, could result in damage to or destruction of equipment.

☞ **NOTE:**

Used to provide additional information that requires special attention by the operator.

</tbody>
</table>
2. SAFETY INFORMATION

Safety Procedures

Do not drive the vehicle if:

- Indicators, instruments or gauges show that a major vehicle operating system is malfunctioning.
- Exhaust fumes seep into the passenger compartment.
- Beneath the vehicle, puddles of engine oil, hydraulic fluid, or coolant have formed.
- Seating stanchions and grab rails are loose or damaged.
- Driving mirrors are broken, missing or cannot be properly adjusted.
- Any exterior or interior light is broken, discolored, or malfunctioning.

Report the occurrence of any of the above to maintenance personnel so the vehicle can be serviced before beginning revenue service.

- Do not operate the vehicle without fastening the seat-belt.
- Make sure obstructions do not block or interfere with your safe range of driving and operating vision.
- Have any debris or garbage removed from the passenger area and the doors. This is important to eliminate any foot obstructions that could cause tripping or falling.
- Make sure all exterior and interior access doors and panels are securely shut and latched.
- Do not smoke around the fuel storage areas, the fuel filling area or during refueling. Do not smoke in areas where fuel, hydraulic fluid, transmission oil or any other flammable fluid has leaked.
Safety Equipment

A hand-held fire extinguisher is located behind the driver’s seat. See “Figure 1: Safety Equipment” on page 10.

Use the extinguisher only after the vehicle is in a safe location, and all passengers are evacuated. Use only if there is no risk to your personal safety.

Figure 1: Safety Equipment
Video Surveillance System

A video surveillance system records events as they occur on the vehicle. The system consists of a digital video recorder and two cameras. The video recorder is located in the electronic equipment enclosure. The cameras are located in the following areas:

- One aft of the entrance door viewing the aisle area.
- One ceiling-mounted in the center of the vehicle viewing rearward.
- One ceiling-mounted in the center of the vehicle viewing the exit doors.

DVR power relay is activated when the Master Run switch is set to either the DAY-RUN, NIGHT-RUN, NIGHT-PARK or STOP-ENGINE position.

Exit Door Sensitive Edges

Pressure sensitive rubber seals are mounted to the leading edges of the exit door panels. If they encounter an object or passenger during door closure, an alarm sounds and the doors fully reopen. The doors will again close once they have fully reopened.

NOTE:

The Interlock System prevents the vehicle from moving until the exit doors have fully closed.
Interlock System

Interlocks disable the accelerator and apply the rear brakes. The interlocks function only when the Master Run switch is in DAY-RUN or NIGHT-RUN position, the Door Master switch is in the ON position, the vehicle speed is below 2 mph, and any of the following conditions occur:

- Entrance or exit doors are open or enabled.
- Exit door emergency valve is actuated.
- Vehicle is kneeling.
- Wheelchair ramp is not stowed.
- Parking brake is applied.
- Loss of air pressure at exit door.
- Loss of brake signal to engine ECM while selecting drive [D].

The Interlock System is intended to protect passengers from inadvertent vehicle movement. The Door Master switch can be used to disable the system for maintenance purposes or in an emergency. Refer to “Door Master Switch” in the Instrumentation & Controls Section of this manual for further information on switch operation.

**NOTE:**

*The brake treadle must be momentarily depressed to release the interlocks.*
3. EMERGENCY INFORMATION

Vehicle Evacuation & Shutdown

In the event of an emergency, pull the vehicle over to a safe location. Evacuate and secure the vehicle using the following procedure in the sequence shown: See “Figure 2: Battery Disconnect Switch” on page 13.

1. Apply the parking brake
2. Open the front and rear passenger doors.
3. Evacuate all passengers to a safe area, away from the vehicle.
4. Alert the transit authority of the emergency.
5. Shutdown the vehicle by setting the Master Run switch to the STOP-ENGINE position.

Figure 2: Battery Disconnect Switch
Assess the situation to determine whether it is safe to approach the rear curbside area of the vehicle before proceeding with the following steps.

6. Approach the rear curbside area of the vehicle and open the Battery Disconnect access door.

7. Shut off all 12/24 VDC electrical power to the vehicle by setting the Battery Disconnect switch to the OFF position.

8. Wait for emergency response personnel to arrive and assist them by providing details of the emergency and the features of the bus that could be of concern to the first responders.
Escape Exits

Side Windows

Two curbside and three streetside windows function as emergency exits and are identified by decals on the window panels.

To operate the emergency window, pull the red handle down and hold. Push out on the bottom of the window frame. The window will open on hinges at the top of the frame. To close, release the handle and slam window shut. See “Figure 3: Window Emergency Handle” on page 15.
Roof Hatches

Both roof hatches are usable as emergency exits. See “Figure 4: Roof Hatch Emergency Exit” on page 16.

1. Pull the red handle at the rear of the hatch to release the locking mechanism. The handle is attached to a cable which will release the retaining pins from the rear hinge.

2. Push upward on the rear section of the hatch, allowing it to swing fully open on the front hinges.

Figure 4: Roof Hatch Emergency Exit
Emergency Release Control Valve, Entrance Door

The entrance door emergency release control valve is located behind a breakable window in the door mechanism access cover. In an emergency, break the window to access the control valve knob. Rotate the knob 90° counter-clockwise to release air pressure from door operator, then push the doors open. As the doors open they activate the header and curb lights. See “Figure 5: Entrance Door Emergency Release Control Valve” on page 17.

Figure 5: Entrance Door Emergency Release Control Valve
Emergency Release Control Valve, Exit Door

The exit door emergency exit control valve is located to the left of the exit door header, behind a hinged window. In an emergency, pull the window open to access the control valve knob. Rotate the control valve knob 90° counter-clockwise to release air pressure from the door operator, then push the doors open. As the doors open they activate the header and curb lights, the brake interlocks, and the Rear Door Open indicator. See “Figure 6: Exit Door Emergency Release Control Valve” on page 18.

Figure 6: Exit Door Emergency Release Control Valve
4. TO ENTER THE VEHICLE

1. Slide the front portion of the driver’s window back to gain access to the door controller handle on the side console. See “Figure 7: To Enter the Vehicle” on page 19.

2. Turn the door controller handle to position #2, #3 or #5 to open the entrance door.

3. If the entrance door does not open, exhaust air by turning the door manual control valve on the side console to the OFF position. Open the door manually by pulling out the door halves at the seal.

NOTE:

Take care not to damage the door seal when pulling the door open.
5. DRIVER’S CHECK LIST

Check the following before putting the vehicle into transit service. Any problems discovered should be brought to the attention of the service personnel.

Exterior

General
- Battery Disconnect switch is in the ON position.
- Engine Run switch in engine compartment is in the FRONT position.
- Check for any fluid puddles under the vehicle.
- Check all exterior panels for any visible damage.
- Check the air intake grille and the exhaust tailpipe for any blockage.
- Bumpers are securely mounted and no damage is evident.
- Bike rack is securely mounted and functions properly.

Access Doors
- Visually inspect door panels for any evidence of damage.
- Check that the access doors unlatch and open easily. Ensure gas struts function properly and maintain door in opened position (where applicable).
- Inspect door panel interior rubber bumpers condition or whether missing.
- All access doors must be closed and securely latched (where applicable) prior to operating vehicle.

Windows
- Check that all windows are closed.
- Ensure window glass is clean and no visible evidence of cracks or other damage.
- Inspect condition of window frames and seals for any damage.
Mirrors
- Inspect condition of mirror housing, glass, and mounting brackets
- Check that mirror head can be easily rotated for adjustment (where applicable).

Lights
- Ensure all lights are clean and not obstructed in any way.
- Check that lights are securely mounted with no missing attaching hardware.
- Inspect lenses for cracks or other damage.

Tires
- Check tire air pressure and ensure it is within the manufacturer’s recommended range.
- Inspect tire tread for abnormal wear, cuts, separation, missing tread, or any other visible defects.
- Inspect tire sidewalls for bulges, cuts, gouges, abrasions, or any other visible defects.

Wheels
- Check for any missing or loose wheel nuts.
- Closely inspect condition of wheel studs if any wheel nuts were found to be loose or missing.
- Visually inspect wheel for any evidence of dents, cracks, deformation, or other damage.
- Inspect wheel surface for pitting or excessive corrosion.

Figure 8: Front Exterior View
Interior

General

- Ensure farebox is securely mounted and operates properly.
- Check all interior panels for any visible damage.
- Ensure front and side destination signs are securely mounted.
- Sunvisors and/or roller blinds are securely mounted and function properly.
- Check that roof hatches open in all ventilation positions and close properly.
- Ensure that roof hatches function properly in the emergency release position.
- Visually inspect condition of passenger signal system and verify operation.
- Ensure door controller moves freely through all operating positions and doors open/close accordingly.
- Door Master switch is in the ON position.
- Check that all driver’s seat adjustments function properly and maintain position.
- Inspect condition of driver’s seat-belt and ensure that it functions properly.
- Inspect condition of wheelchair restraint system and ensure that all mechanisms function properly.
- Check steering wheel operation with engine running. Steering should operate smoothly without binding or erratic movement.
- Check steering wheel tilt/telescope lever functions properly.
- Ensure that the wheelchair ramp functions properly and that the alarm sounds when stowing or deploying the wheelchair ramp.

Access Doors

- Visually inspect interior door panels for any evidence of damage.
- Check that the access doors unlatch and open easily. Ensure gas struts function properly and maintain door in opened position (where applicable).
- Check for any missing or damaged rubber bumpers on the inside of the door panel
- All access doors must be closed and securely latched (where applicable) prior to operating vehicle.

18. Windshield Washer Filler

Figure 9: Rear Exterior View
Seats
- Ensure seats are clean and there is no evidence of cuts, tears, or other damage.
- Ensure seats are securely mounted to seat rail and floor (where applicable).

Floor
- Check overall condition of flooring for cleanliness.
- Inspect flooring for any evidence of excessive wear, cuts, or other damage.
- Inspect edges of flooring and nosing for evidence of lifting or separation.
- Ensure the wheelchair ramp is fully stowed flush with the flooring surface and does not provide a tripping hazard.

Windows
- Check that windows are clean and undamaged.
- Check operation of emergency release mechanism on all windows so equipped. Ensure windows release from the frame and open fully outward for emergency egress.
- Check operation of all windows equipped with slider or tilt openings. Windows should slide or tilt easily and not be loose in the frame.

Mirrors
- Check condition of mirror glass for cracks or other damage.
- Ensure mirrors are securely mounted and maintain their adjusted position.
- Ensure mirrors offer a clear view and are not obstructed.

Passenger Doors
- Check that doors open/close properly.
- Check door panels for dents, deformation or other damage.
- Inspect door panel glass for cleanliness and ensure glass is not cracked or otherwise damaged.
- Inspect door edges and seals for condition and proper sealing.

Modesty Panels/Barriers
- Inspect condition of panels for sharp edges, cracks, or any other damage.
- Ensure panels are securely mounted to stanchions and vehicle structure.
Stanchions & Grab Rails

- Inspect for bent or cracked tubing, rails, or any other damage.
- Ensure that all stanchions and grab rails are securely mounted.
- Inspect for any sharp edges.
- Inspect for any missing attaching hardware.
- Inspect condition and secure mounting of grab straps (where applicable).

Lights

- Ensure all lights are clean and not obstructed in any way.
- Check that lights are securely mounted with no missing attaching hardware.
- Inspect lenses for cracks or other damage.

Indicator Lights

**NOTE:**

*From this point on, items on the driver’s check list require activating the vehicle’s Multiplexing System and starting the engine. Turning the Master Run switch on the side console to DAY-RUN or NIGHT-RUN activates the Multiplexing System. Wait for the system to activate before starting the engine. Refer to the Vehicle Operation Section of this manual for details on engine starting.*

- The Stop Request indicator illuminates when the passenger signal system is activated.
- The W/C Stop Request indicator illuminates when the wheelchair passenger signal system is activated.
- The Parking Brake indicator illuminates when the parking brake is applied.
- The Stop indicator illuminates when the brakes are applied.
- The Turn indicator illuminates and flashes when the turn signal switch is activated or the Hazard switch is turned on.
- The Rear Door Open indicator illuminates when the exit door is open.
- The High Beam indicator illuminates when the high beam headlights are on.
- The Kneel indicator illuminates when the kneeling system is activated.
- The No Gen and Stop Engine indicators illuminate momentarily, then extinguish.
- The remaining indicators relate to vehicle operation concerns and should be checked by service personnel.
Electrical Control Systems

- The Master Run switch controls the electrical circuits. Refer to the Instrumentation & Controls Section of this manual for more information.
- Light switches, located inside the service compartments, activate the compartment lights.
- Windshield washers spray washer fluid onto windshield.
- Wipers operate (on wet windshield) without streaks, scraping or noisy operation.
- Hazard lights function with the Master Run switch in any position.
- Horn sounds when horn button on steering wheel pressed.
- Rear brake lights illuminate when the brake pedal is applied.
- Destination/route sign circuits function with the Master Run switch in DAY-RUN, NIGHT-RUN or NIGHT-PARK positions.
- All side console control switches function.
- Passenger signal and chime circuits function.
- Accelerator treadle accelerates the engine.
- Shift Selector switch functions.
- Backup lights illuminate when the transmission is shifted to reverse.
- HVAC System functions when the engine is running.
- Speedometer functions when the vehicle is moving.

Air Control Systems

- Normal vehicle operation pressure ranges from 105 to 125 psi (724 to 862 kPa).
- Low Air indicator illuminates and an alarm sounds if the air system pressure drops below 75 psi (517 kPa).
- Entrance and exit doors open and close smoothly.
- Brake treadle application slows and stops the vehicle smoothly.
- Parking brake valve application holds the vehicle stationary when level or on a 20% maximum incline grade when on dry concrete.
- Door manual control valve, located below the side console, shuts off the air supply to the entrance door mechanism. When in the OFF position, the doors can be pushed open.
- Splash guards clear the ground (vehicle on level surface) with the air system pressure at or above 105 psi (724 kPa).
- Compressor cuts in when the air system pressure drops to approximately 105 psi (724 kPa) and shuts off at approximately 120 to 125 psi (827 to 862 kPa).
6. DRIVER’S AREA

The driver’s area includes the first eight feet of interior space measured from the front windshield. This section describes the controls and components within the driver’s area. A brief outline of the functions and operating procedures of each accompanies the description. See “Figure 10: Driver’s Front Area” on page 28. See “Figure 11: Driver’s Side Area” on page 29.

![Diagram of Driver’s Front Area](op17329a.svg)

**Figure 10: Driver’s Front Area**
Driver’s Window

The driver’s window has a single front sash with handles on the inside and outside. Pull the sash handle back to open the window. Push the handle forward to close.
Mirrors

The vehicle is equipped with the following mirrors:

Aisle Mirror

The aisle mirror is located under the front destination sign closeout. Its convex glass surface provides a wide view of the entrance door and passenger area.

Upper Right Mirror

Located to the right of the aisle mirror, the upper right mirror is used to view the rear mirror.

Exit Door Area Mirror

The exit door area mirror is located on a stanchion at the exit door. It provides a view of the exit door area when looking through the upper right mirror from the driver’s seat.

Roller Blinds

There are two roller blinds in the driver’s area; one for the front windshield and the other for the driver’s window. The blinds can be extended or retracted by either pushing or pulling on their handles.

Electronic Equipment Enclosure

The electronic equipment enclosure is located on the streetside wheelhousing and is used for storing the vehicle communication and monitoring equipment. The lockable access door provides security for the stored contents and the slide-out trays provide easy access for servicing the electronic equipment.

Driver’s Locker

Located above the driver’s window, the driver’s locker is for storing personal belongings.
Driver’s Overhead Panel

The driver’s overhead panel is a recessed panel located above the driver that contains the destination sign controller and P.A. System amplifier. See “Figure 12: Driver’s Overhead Panel” on page 31.

Refer to “Destination/Route Signs” in this manual for information on the operation of the destination sign controller. Refer to “Public Address System” in this manual for information on the operation of the P.A. amplifier.

Figure 12: Driver’s Overhead Panel
Driver’s Seat

The USSC 9100ALX driver’s seat is an adjustable air suspension seat consisting of a steel frame base and back panel and molded foam cushions. The seat-belt retracts to holders beside the seat cushion. See “Figure 13: Driver’s Seat” on page 32.

Eight controls adjust the positioning of the seat and seat cushions to suit the needs of the individual. Make position adjustments to provide for the best driving visibility and control.

Figure 13: Driver’s Seat

1. Bellows
2. Mechanical Slide Release Lever
3. Bottom Lumbar Adjustment
4. Top Lumbar Adjustment
5. Side Bolster Adjustment
6. Seat Tilt Control
7. Seat-Belt Clip
8. Backrest Adjustment
9. Adjustable Headrest
Lumbar & Side Bolster Adjustment

Three rocker switches on the right side of the seat adjust the top lumbar, bottom lumbar and side bolster. The rocker switches admit or release air pressure to three air bags in the seat back. When making adjustments, momentarily hold the switches in position to allow time for air movement.

Height Adjustment

The knob on the front left corner of the seat adjusts the height. Turn the knob counter-clockwise to raise the seat and clockwise to lower it. Pull the knob out to dump air pressure and reset to the previous adjustment by pushing the knob in.

Tilt Adjustment

Adjust the seat’s fore and aft tilt with the large control knob on the side of the seat. Turn the knob clockwise to tilt forward and counter-clockwise to tilt rearward.

Fore & Aft Track Adjustment

The fore and aft track adjustment has nine position settings. Push the button located in the right front corner of the seat to unlock and slide the seat to the desired position. Release the button and move slightly fore or aft to set lock.

Back Recline Adjustment

Adjust the backrest to the desired recline position by turning the control knob located at the bottom of the backrest.

Suspension Lockout/Limiter Control

Located on the left rear of the seat is a three-position lever to control seat suspension movement. The outward position allows full seat suspension movement; the middle position limits the suspension and the inward position locks the suspension.
Steering Wheel & Horn

Steering Wheel

**WARNING**

DO NOT make adjustments to the tilt steering while the vehicle is in motion.

**CAUTION**

DO NOT turn the steering wheel if the engine is not operating except in emergency situations.

**CAUTION**

DO NOT OPERATE THE VEHICLE if any of the following conditions exist:

- Binding or resistance in the steering wheel operation (with the vehicle in motion).
- Unusual noises related to steering.
- Steering wheel vibration.
- Looseness, binding or resistance in the tilt/telescopic mechanism.

A hydraulic powered steering system turns the front wheels when moving the steering wheel left or right (the engine must be operating to power the system). The tilt/telescopic steering column offers a range of positions for the steering wheel. A lever on the left of the column controls both tilt and telescopic functions. Push to telescope and pull to tilt. See “Figure 14: Steering Wheel Adjustment” on page 35.
Horn

The horn button, located in the center of the steering wheel, operates the dual horn.
Public Address System

The Public Address System (P.A.) allows the communication of messages to the public both inside and outside the vehicle. Components of the system include: See “Figure 15: P.A. System Layout” on page 36.

- A P.A. microphone located on the left windshield pillar.
- Six interior speakers located above the side windows.
- An exterior speaker located above the entrance door.
- An amplifier mounted in the driver’s overhead panel.

To use the system, rotate the volume knob on the amplifier to the desired level and position the Speaker Select toggle switch on the side console to operate the desired speakers. Then speak into the microphone.

Figure 15: P.A. System Layout
Destination/Route Signs

**NOTE:**
The following information provides basic introductory information on ODK and Luminator Destination Sign System operation. Your transit authority management establishes policies about system operation and should be consulted before its use. Manuals are available from Luminator which provide more information about the Operator’s Display Keyboard and the Luminator Destination Sign System.

Operation Using the Operator’s Display Keyboard (ODK4)

Basic operation of the Sign System involves presetting transit authority message codes into the sign system using the ODK. The message codes correlate to preprogrammed destination names, public relations messages, and route numbers unique to each transit authority. If required, multiple sets of message codes may be entered to allow for a quick and complete sign change while in route. Key function and basic operation instructions are described in the two sections that follow.

**ODK4 Operating Keys**

Six soft keys are located on the bottom of the LCD display screen. The function of these soft keys is identical to the corresponding hard keys located directly below the display screen. The soft keys and hard keys can be used interchangeably. See “Figure 16: Operator’s Display Keyboard (ODK)” on page 38. The keys function as follows:

- **MENU** - used to access advanced programming (some may require a password).
- **RUN** - used to enter run number. This function is determined by transit authority programming.
- **ROUTE** - used to enter route number. This function is determined by transit authority programming.
- **P/R** - used to enable public relations message code entry. This switch may be disabled if public relation messages are not available.
- **ROUTE** - press to enable route number entry. Route number entry may be either coded or be the actual route number for display.
- **DEST A and DEST B** - used to enable respective destination message code entry for message display change. These switches are permanently enabled.

All destination and public relations (P/R) messages can be set and viewed from the ODK.
Basic Operating Procedures

Basic operating procedures are as follows:

- Set RUN number - press the RUN key on the default screen. Enter the run number via the ODK number pad and then press ENTER. The message “RUN button not used” will appear if the manual entry feature has been disabled.

**NOTE:**

*To change a RUN number, use the left/right arrow keys to highlight a number and then press CLEAR (or press DEL to delete an entire string).*

- Set ROUTE number - press the ROUTE key on the default screen. Use the ODK keypad to enter a route number or left/right arrow keys to highlight a letter, then press SELCT to select it. After entering the route number, press the hard ENTER key. The route number just entered will be displayed on the ODK as well as on the route signs. This route number will persist when you go from DEST A to DEST B without having to re-enter it.
NOTE:

To change a ROUTE number, use the right arrow key to move the square cursor to the end of the string and then use the left arrow key to move cursor back to the left to erase existing numbers (you cannot simply overwrite them).

- Set Public Relations (P/R) message - press the P/R key on the default screen. Enter the P/R message code number via the ODK number pad and press ENTER. The P/R code number will display on the ODK display screen and the route signs approximately 5 seconds after it is entered.

NOTE:

To change a P/R code number (or clear the message altogether) use the left/right arrow keys to highlight a number and press CLEAR to erase it (or press DEL to delete an entire string) then press ENTER.

- Set Destination A or B message - press the DestA key on the default screen to set the DestA message. Enter the destination code number via the OKD number pad and press the hard ENTER key. The destination code number will display on the ODK display screen and the route signs approximately 5 seconds after it is entered. Setting Destination B is performed in the same manner as setting Destination A.

NOTE:

To change a destination number, use the right arrow key to move the square cursor to the end of the string and then use the left arrow key to move cursor back to the left to erase existing numbers (you cannot simply overwrite them).

- Set Display Brightness Level - press MENU on the default screen to access menu options. From the MENU screen press the PREF key. From the PREF screen press the BRGHT key. From the BRGHT screen touch the brightness level bar at the top of the screen or use the left/right arrow keys to set the brightness level, then press OK.

NOTE:

To return the display to the original factor default brightness level press the DFLT key from the PREF screen, then press YES.

- Set Aisle Light Dimming Level - press MENU on the default screen to access menu options. From the MENU screen press the DIMNG key. From the DIMNG screen touch the dimming level bar at the top of the screen or use the keypad left/right arrow keys to set the dimming level, then press OK.
7. ENTRANCE DOOR AREA

The entrance door area includes the following components: See “Figure 17: Entrance Door Area” on page 41.

- A slide glide style door that is air-opened and air-closed
- An entrance door emergency release valve
- An entrance door header light

Placing the door controller in positions #2, #3, or #5, will open the entrance door.

When the master run switch is in DAY-RUN, the door header lights will illuminate when the entrance door is open and the wheelchair ramp is deployed. In NIGHT-RUN or NIGHT-PARK the door header lights will illuminate when the entrance doors are opened.

Boarding passengers can use the door mounted handles to assist in entering the vehicle.

In the event of an emergency situation with an inoperable door, the emergency release valve located behind the mechanism access door, can be operated to release air pressure from holding the door closed. Refer to the Emergency Information Section of this manual for emergency release valve operating instructions.
Figure 17: Entrance Door Area
8. EXIT DOOR AREA

The exit door area includes the following components: See “Figure 18: Exit Door Area” on page 43.

- A slide glide style door that is air-opened and air-closed
- An exit door emergency release valve
- A green LED exit door enabled light
- Stop request buttons on the exit door stanchion

Placing the door controller in positions #3, #4, or #5, opens the exit door. The green overhead light illuminates when the exit door is opened. The door header lights illuminate when the exit door is open and remains illuminated for five seconds after the door closes.

In the event of an emergency situation with an inoperable door, the emergency release valve located in the upper left corner can be operated to release air pressure from holding the door closed. Refer to “3. EMERGENCY INFORMATION” on page 13 in this manual for emergency release valve operating instructions.
The New Flyer vehicles described in this manual may be protected by one or more patents and design applications or registrations in the United States and Canada, and in other countries. Refer to “Vehicle Patent Information” in this manual.

Figure 18: Exit Door Area
9. INSTRUMENTATION & CONTROLS

Instrument Panel

The instrument panel is located directly in front of the driver and provides a visual display of the vehicle operating systems as well as providing controls for the various systems. The instrument panel cluster is a programmable electronic unit with diagnostic capabilities. See “Figure 19: Instrument Panel” on page 46.

Turn Indicators (Green)

![WARNING]

If turn signal indicators do not operate as described, DO NOT OPERATE THE VEHICLE.

The turn indicators, symbolized by directional arrows, flash on either side of the instrument panel when the right-hand or left-hand floor-mounted turn signal switch is pressed.

When the Hazard switch is activated, both turn indicators flash together. Failure of these lights to flash normally indicates that the flasher module is not functioning.

Low Oil Indicator (Red)

![CAUTION]

If the Low Oil alarm continues and the indicator lamp remains illuminated, DO NOT OPERATE THE VEHICLE.

The Low Oil indicator illuminates if the engine oil pressure is too low for proper engine lubrication. The Low Oil indicator is accompanied by a warning buzzer.

Before starting the engine, positioning the Master Run switch to DAY-RUN or NIGHT-RUN illuminates the Low Oil indicator and sounds its alarm. This occurs momentarily and is a normal electrical system test.
The New Flyer vehicles described in this manual may be protected by one or more patents and design applications or registrations in the United States and Canada, and in other countries. Refer to “Vehicle Patent Information” in this manual.

Copyright © 2011 New Flyer Industries Canada ULC

**NOTE:**

If this indicator remains illuminated, the Engine Protection System engages to initiate an automatic engine shutdown sequence.

---

### Low Coolant Indicator (Amber)

The Low Coolant indicator illuminates if too little coolant is in the engine to maintain normal engine operating temperature.

**NOTE:**

If this indicator remains illuminated, the Engine Protection System engages to initiate an automatic engine shutdown sequence.

---

### Diesel Exhaust Fluid (DEF) Indicator (Amber)

The DEF symbol will illuminate to indicate that the fluid level in the tank is low and needs to be refilled. Notify maintenance personnel if this indicator illuminates.

---

### Hot Engine Indicator (Red)

The Hot Engine indicator will illuminate if the engine exceeds its normal operating temperature and overheats. The Hot Engine indicator is accompanied by a warning buzzer.

**NOTE:**

If this indicator remains illuminated, the Engine Protection System engages, initiating an automatic engine shutdown sequence.
The New Flyer vehicles described in this manual may be protected by one or more patents and design applications or registrations in the United States and Canada, and in other countries. Refer to "Vehicle Patent Information" in this manual.

Stop Engine Indicator (Red)

The Stop Engine indicator illuminates if an engine operating condition occurs that will result in damage to the engine. The indicator is controlled by the vehicle’s Multiplexing System which monitors engine sensor output. If the Multiplexing System illuminates the indicator it also initiates an engine shut-down sequence.

As an operation check, the Stop Engine indicator should remain illuminated momentarily when the engine is started.

**NOTE:**

If this indicator remains illuminated, the engine will continue running for 30 seconds. Use the time to drive out of traffic to a safe area.

Check Engine Indicator (Amber)

If after engine start-up the Check Engine indicator remains illuminated, advise service personnel. Avoid extended periods of operation with this indicator illuminated.

The Check Engine indicator illuminates if the engine requires service. The indicator is controlled by the vehicle’s Multiplexing System which monitors engine sensor output. The Multiplexing System will illuminate the indicator if sensor output signals fall outside of a predetermined range.

ABS Fail Indicator (Amber)

The ABS Fail indicator illuminates if the ABS System requires service. Engine start-up illuminates the indicator momentarily as part of a system check. It is also used during diagnostics to display the blink code. Refer to the Vehicle Operation Section of this manual for further information.
Parking Brake Indicator (Red)

The parking brake indicator, symbolized by a circled letter “P” illuminates when the parking brake control valve is applied. Activating the parking brake illuminates the stop lights indicator and all red stop lamps.

Exhaust Regen Needed Indicator (Amber)

This indicator will either illuminate steady or flash and may illuminate in combination with the Check Engine indicator to indicate the various stages of soot buildup in the muffler particulate filter. Refer to the following chart for a description of various conditions and actions required when this indicator illuminates.

<table>
<thead>
<tr>
<th>DPF Soot Level</th>

</tr>
</tbody>
</table>

Note 1: Moderate derate of engine torque.
Note 2: Severe derate or engine speed.
Note 3: Stationary regeneration will be disabled.
High Exhaust Temp Indicator (Amber)

If the High Exhaust Temp indicator on the instrument panel illuminates, ensure the exhaust outlet is not located where it could cause damage to persons or any materials which could melt or explode, and that nothing is within 2 feet of the outlet. Ensure no combustible materials are within 5 feet of the outlet. Exhaust outlet temperatures can reach 1500°F (800°C) when this indicator illuminates.

The High Exhaust Temp indicator illuminates if excessive exhaust temperatures are detected.

**NOTE:**

Notify service personnel if this indicator remains illuminated.

Engine Fan Fault (Amber)

The Engine Fan Fault indicator will illuminate if a fault is detected with the fan drive cooling system. A low hydraulic fluid level signal or a high speed fan with engine cold condition will register as a fault.

**NOTE:**

Notify service personnel if this indicator remains illuminated.
Stop Lights Indicator (Red)

![Stop Lights Indicator](image1)

**WARNING**

If the stop lights indicator does not operate as described, **DO NOT OPERATE THE VEHICLE.**

The stop lights indicator, symbolized by a circled letter S, illuminates each time the service brake or parking brake control valve is applied. If under these circumstances the indicator does not illuminate, then any or all rear stop lights are malfunctioning.

Retarder Off Indicator (Red)

![Retarder Off Indicator](image2)

The Retarder Off indicator illuminates to indicate that the Retarder switch is in the OFF position disconnecting power from the transmission retarder.

Stop Request Indicator (Red)

![Stop Request Indicator](image3)

The Stop Request indicator illuminates when the passenger signal system has been activated.

No Gen Indicator (Red)

![No Gen Indicator](image4)

**CAUTION**

If the no gen indicator remains illuminated while the engine is operating, **DO NOT OPERATE THE VEHICLE.**

The no gen indicator, symbolized by a battery, illuminates when the alternator is not charging. The no gen indicator illuminates when the Master Run switch is in the DAY-RUN or NIGHT-RUN position and the engine is not operating. The no gen indicator turns off once the engine is operating.
W/C Stop Request Indicator (Amber)

The Wheelchair Stop Request indicator illuminates when the wheelchair passenger signal system has been activated.

Exclamation Symbol (Red or Amber)

The Exclamation Symbol will illuminate when a text message tell tale appears in the Message Display Screen. The color of the exclamation symbol will change to match the message currently being displayed on the screen.

Rear Door Open Indicator (Red)

The Rear Door Open indicator illuminates when the door controller is turned to position #3, #4 or #5 and the exit door opens.

Kneel Indicator (Amber)

The Kneel indicator illuminates when the front suspension is in the kneeling mode and is lowering the vehicle to the curb.

NOTE:

The Kneel toggle switch is located on the instrument panel.
Wait to Start Indicator (Amber)

The Wait to Start indicator illuminates before engine start-up with the Master Run switch in the DAY-RUN or NIGHT-RUN position. The indicator will remain illuminated for up to 45 seconds while the intake air heater system operates.

**NOTE:**

*The Wait to Start indicator and the intake air heater system will only operate in temperatures below 66°F (19°C).*

High Beam Indicator (Blue)

The high beam indicator, symbolized by a lit headlight, illuminates when the vehicle headlights are in the high beam mode of operation. Pressing the dimmer switch returns the headlights to normal low beam operation.

Mode Button

The Mode button is used primarily to navigate between the Message Display Screen and the Odometer/Hourmeter Display Screen and to navigate through the menus and select various options available on the selected screen. The button function is dependent on the length of time it is pressed. Refer to “Message Display Screen” and “Odometer/Hourmeter Display Screen” in this section for information on the operation of this button.

Enter Button

The Enter button is used to navigate through the menus on the Message Display Screen and to switch screen formats on the Functional Readout Screen. The Enter button can also be used to reset the trip meters on the Odometer Display Screen. The button function is dependent on the length of time it is pressed. Refer to “Message Display Screen” and “Odometer/Hourmeter Display Screen” in this section for information on the operation of this button.
Air Pressure Gauges

Individual analog air pressure gauges are used to monitor the vehicle’s front and rear air brake systems. An LED indicator at the bottom of the gauge illuminates and a warning buzzer sounds if air pressure drops below 75 psi (517 kPa). If air pressure exceeds the normal operating range, the LED indicator will flash. Normal operating pressure range is 105 to 125 psi (724 to 862 kPa).

NOTE:

The analog-driven gauges will indicate current values and the warning LED indicators in the data gauges will flash if the Master Run switch remains in the DAY-RUN or NIGHT-RUN position without the vehicle being started.

Speedometer

This gauge indicates the vehicle’s forward speed. The speedometer will initialize as soon as the Master Run switch is set to the DAY-RUN or NIGHT-RUN position. During this self-test process the gauge will sweep full scale and then return to the zero point.

NOTE:

Refer to “Odometer/Hourmeter Display Screen” in this section for information on the odometer.
Message Display Screen

The larger of the two LCD screens is located between the air pressure gauges and is used to display text messages to warn the driver of potential problems. The screen will change color, from blue to amber to red, depending on the severity of the warning message.

The message display screen has four separate menus. Navigate through the menus by performing a long press (over 3 seconds) on the ENTER button. See “Figure 20: Function Readout Screen” on page 55.

- Function Readout (default screen) - this screen displays the diesel exhaust fluid level and the battery voltage. Change the readout between bar graph and digital using a short press (1 to 3 seconds) on the ENTER button.
- Active LCD Tell Tale Overview - this screen displays a list of the active tell tale messages
- IP Software Version - this screen displays the IP software version, configuration file label, and routing table label.
- VMM Query - this screen displays the application and ladder logic version of the VMM multiplexing modules on the vehicle.

☞ **NOTE:**

*There are no operator navigable or resettable features in the IP Software Version or VMM Query screens.*

Perform a long press (greater than 3 seconds) on the MODE button to navigate between the Message Display Screen and the Odometer/Hourmeter Display Screen. If the Odometer/Hourmeter Display Screen has been selected, then an arrow pointing to it will appear in the lower right-hand corner of the Message Display Screen.
Function Readout Displays

- Diesel Exhaust Fluid Level - displayed on a bar graph as percentage of fluid remaining in the tank.
- Voltmeter (24V) - the voltmeter indicates the voltage levels in the vehicle’s 24 volt electrical system. The normal operating range is between 24 and 28.5 volts.

**NOTE:**

Notify service personnel if the readings fall outside of this range.
Text Messages

• Auxiliary Heater (amber) - The Auxiliary Heater message will appear on the LCD screen when the engine coolant heater functions. It starts automatically in cold conditions to heat the engine coolant to operating temperature.

**NOTE:**

_The engine coolant heater operates only when the Master Run switch is in either the DAY-RUN or NIGHT-RUN position._

• RH Headlight Fault (amber) - The RH Headlight Fault message will appear on the LCD screen to indicate a fault with a low beam headlight. Notify service personnel if this message appears on the screen.

• RH Turn Fault (amber) - The RH Turn Fault message will appear on the LCD screen to indicate a fault with the right-hand turn light. Notify service personnel if this message appears on the screen.

• LH Headlight Fault (amber) - The LH Headlight Fault message will appear on the LCD screen to indicate a fault with the low beam headlight. Notify service personnel if this message appears on the screen.

• LH Turn Fault (amber) - The LH Turn Fault message will appear on the LCD screen to indicate a fault with the left-hand turn light. Notify service personnel if this message appears on the screen.

• Hot Trans (Red) - this message will advise that the oil in the transmission exceeds the maximum rated operating temperature. Immediately move the vehicle to a safe area and shut down the system.

• Check Trans Fault (Red) - The Check Trans Fault message will appear if the transmission electronics has detected a potentially serious problem in the transmission. If this message appears, DO NOT OPERATE THE VEHICLE.

• Retarder On (Amber) - The Retarder On message appears to indicate operation of the transmission retarder.

• Starter Lock Out (Amber) - The Starter Lock Out message will appear if the starter enters the protect mode after 14 cumulative seconds of cranking.
Odometer/Hourmeter Display Screen

The smaller of the two LCD screens is located directly below the speedometer and contains the odometer, two trip odometers and an engine hour meter. The display screen has four separate menus. Navigate through the menus by performing a quick press (less than 1/2 second) on the MODE button. See “Figure 21: Odometer/Hourmeter Display Screen Options” on page 57.

**NOTE:**

The trip odometers can be reset by navigating to the appropriate screen with the MODE button, and then performing a short press (1 to 3 seconds) on the ENTER button.

Perform a long press (greater than 3 seconds) on the MODE button to navigate between the Message Display Screen and the Odometer/Hourmeter Display Screen.

![Figure 21: Odometer/Hourmeter Display Screen Options](op7303a.wmf)
Transmission Shift Selector

**CAUTION**

In temperatures below -20°F (-29°C), set the Idle Speed switch on the side console to FAST to warm the transmission. Reset the switch to NORMAL before shifting from neutral [N], to reverse [R] or drive [D].

**CAUTION**

Be sure to bring the vehicle to a full stop before shifting from drive [D] to reverse [R] or vice versa.

The transmission shift selector is located on the right-hand side of the instrument panel. The shift selector module has six push button switches and a LED display. Three switches control the reverse [R], neutral [N] and drive [D] transmission selections. The other switches are MODE, UP arrow and DOWN arrow. Their functions are as follows:

- The UP and DOWN arrows allow shifting the transmission through its drive ranges manually.
- The UP and DOWN arrows also initiate the transmission diagnostics system when pressed simultaneously. Press them once for diagnostics and twice for oil level readings.
- The MODE button is inoperable.

Ramp Switch

**CAUTION**

The Ramp toggle switch is a momentary type. If pressure is removed, the switch returns to the center FLOAT position and operation ceases.

This is a three-position switch that controls the wheelchair ramp.

**DEPLOY**

This position activates the ramp from the closed position to the open position.

**FLOAT**

This position shuts off power to the pump, allowing the ramp to free-fall to either the open or the closed position. Upon cycle completion this becomes an off position.
STOW

This position is used to move the ramp from the open to the closed position.

**NOTE:**

Refer to the Wheelchair System Section of this manual for operating procedures.

Kneel Switch

![CAUTION]

When placed in the RAISE position, the Kneel toggle switch will latch and continue to raise the vehicle until full ride height is reached at which point the raising action will automatically stop. In order to interrupt the raising operation during its cycle, the toggle switch must be set to the HOLD position.

This three-position momentary switch is used to operate the vehicle’s kneeling system. The kneeling system lowers the front of the vehicle approximately 3 to 4 inches by exhausting air from both front suspension air springs. Boarding the vehicle becomes easier, particularly for small children and the handicapped.

LOWER

This position lowers the vehicle, activating the interlocks, the audible alarm and the exterior warning light. The instrument panel Kneel indicator also illuminates.

**NOTE:**

The Kneel toggle switch is a momentary spring loaded switch that will operate in the LOWER position only as long as pressure on the switch is maintained.

RAISE

This position raises the vehicle automatically to its full ride height. Once the vehicle has reached normal ride height, the interlocks will release (with doors closed), the alarm will silence and the exterior warning light and Kneel indicator will both extinguish.

**NOTE:**

Closing the switch guard locks the switch in the RAISE position.
HOLD

During the kneeling cycle, this position stops kneeling operations, silences the alarms and extinguishes the exterior warning light. The Kneel indicator and the interlocks remain activated.

Wiper/Washer Controls

Two wiper control switches operate the left-hand and right-hand wiper motors. The intermittent position allows turning of the control knob to vary the delay of the wiper sweep in times of light rain. In the low or high position the wipers operate at fixed speeds. Pushing down on the knob operates the windshield washer pump to spray fluid onto the windshield.

⚠️ NOTE:

The windshield washer bottle filler is located near the left headlight.

Panel Lights Dimmer Switch

The Panel Lights Dimmer switch controls the brightness of the instrument panel lighting. Rotating the dimmer knob clockwise increases the brightness and counter-clockwise decreases the brightness of the panel lights.
Driver’s Climate Controls

See “Figure 22: Driver’s Area Climate Controls” on page 62.

Defroster Fan Control

The defroster Fan knob on the instrument panel controls the speed of the driver’s heater/defroster fan. Turning the knob from the extreme left (OFF position) to the right provides variable fan speed settings.

Defroster Air Recirculation Control

The Air knob on the instrument panel controls the amount of fresh air circulated through the driver’s heater/defroster system. This knob can be set to recirculate all or a portion of air entering the heater compartment and admit a corresponding amount of fresh air.

Defroster Temperature Control

The Temp knob on the instrument panel controls the temperature of the air blowing from the defroster. Turn the knob from left to right to decrease temperature and from right to left to increase temperature.

Driver’s Vent

The vehicle is equipped with a lower vent that allows outside air to enter the vehicle interior during forward motion. The lower vent inlet is located on the left front corner below the windshield. The vent control is located below the instrument panel. Turn the knob clockwise to increase air flow.
Driver’s Floor Heat

The driver’s floor heat control is located below the instrument panel and controls the defroster/heater outlet to the floor area of the driver’s platform. Turn the knob counter-clockwise to increase the foot heat setting.

**NOTE:**

*Use the Temperature control knob on the instrument panel to set the floor heat air temperature.*
Side Console Switch Panel

See “Figure 23: Side Console Panel” on page 64.

Layover Signal Switch

The Layover Signal toggle switch controls the curbside (right) turn indicator lights. Position the switch to ON and only these lights will flash at regular intervals.

Overhead Fan Switch

The Overhead Fan switch is a three-position toggle switch that controls the overhead fan located above the windshield. Position the switch to either the LOW or HIGH position for the desired fan speed. The OFF position deactivates the fan.

Rear Heater Controls

The Rear Heater Control toggle switch is a three position toggle switch that controls the Heating & Ventilation system. In the HEAT position, the system will maintain a preset temperature. In the VENT position, the main unit operates to draw fresh air into the vehicle. The OFF position deactivates the system. The Rear Heater Fan Speed toggle switch controls the fan speed of the main heater unit. Position switch to either HIGH or LOW for a desired speed.

Hazard Lights Switch Indicator

The Hazard Lights Switch indicator illuminates when the Master Run switch is in the NIGHT-RUN or NIGHT-PARK position. It serves only to highlight the position of the Four-Way Hazard Lights switch.
Figure 23: Side Console Panel
Four-Way Hazard Lights Switch

The Hazard Lights toggle switch has an ON and OFF position. When the switch is ON, the instrument panel turn indicators and the exterior signal lights flash.

When the switch is OFF, the exterior signal lights function only as turn signals. The exterior signal lights and instrument panel turn indicators flash when the left or right turn signal foot-switch is pushed and held.

Activate the four-way hazard lights when the transit vehicle is stopped or parked in an area and may block traffic or present a possible hazard to following or approaching vehicles. Also use the four-way hazard lights when the vehicle is being towed.

Driver’s Light Switch

The Driver’s Light toggle switch is a two-position switch that controls the light above the driver.
Master Run Switch

The Master Run Switch is a 4-position rotary switch. The DAY-RUN, NIGHT-RUN, and NIGHT-PARK positions are used to activate the vehicle Multiplexing System and energize various 12/24V electrical circuits. The STOP-ENGINE position is used to shutdown the engine and de-energize the Multiplexing System and most 12/24V electrical circuits except those associated with safety functions. The Battery Disconnect switch must be set to the OFF position in order to disconnect the remaining 12/24V circuits from the vehicle batteries. The following table provides a list of circuits energized by the various Master Run switch positions:

NOTE:
The Multiplexing System is programmed to remain active for 30 minutes after the Master Run Switch is set to the STOP-ENGINE position.

Note 1: Engine must be running
Note 2: DAY-RUN also requires W/C ramp deployed
Note 3: Multiplexing system must be active
Door Controller

WARNING

Positioning the Door Master switch to OFF disables the brake interlocks and the exit door controller.

The door controller opens and closes the entrance and exit doors. The five positions of the controller and the related door functions are as follows: See “Figure 24: Door Controller” on page 68.

- Position #1: Entrance door closed, exit doors closed.
- Position #2: Entrance door open, exit doors closed.
- Position #3: Entrance door open, exit doors open.
- Position #4: Entrance door closed, exit doors open.
- Position #5: Entrance door open, exit doors open.

When the exit door is open, the brake and accelerator interlocks apply automatically and the stop lights indicator illuminates.
Mirror Heater Button

This push button powers the heater elements behind the right and left exterior mirrors. The button illuminates to confirm heater element operation.

Parking Brake Control Valve

![WARNING]

If the air pressure is below 40 psi (276 kPa), the parking brake valve will return to the applied position.

The parking brake control valve controls the application or the release of the parking brake. Pulling up on the control knob applies the parking brake. Pushing down on the knob releases the parking brake.

Emergency Brake Release Control Valve

This valve supplies the air pressure to release the rear brakes if the air system pressure drops below 40 psi (276 kPa) and the rear brakes apply automatically. Pushing down and holding the valve allows the air pressure to release the rear brakes. Releasing the valve knob shuts off the air pressure supply, allowing the rear brakes to re-engage.

**NOTE:**

The emergency brake release is for emergency use only. It allows the operator to move the vehicle away from a potentially dangerous location when the air system has failed. The rear brakes remain released as long as the valve is pressed. The brakes will drag at about 65 psi (448 kPa) even though the parking brake is in the released position.
Remote Mirror Control Switch

The Remote Mirror Control switch allows the operator to adjust the curbside mirror from the driver's seat.

Emergency Door Switch

The Emergency Door switch is a guarded toggle switch that changes the function of door controller positions #3, #4 and #5. Lift the switch guard up to change the door controller function from door enable to door open. Lowering the switch guard returns the switch to the door controller enable position.

Start Push Button

![WARNING]

Put the shift selector in neutral [N] and apply the parking brake before starting the engine. If the parking brake indicator does not illuminate, DO NOT OPERATE THE VEHICLE.

This momentary push button on the side console allows the operator to start the engine without leaving the driver’s seat.

☞ NOTE:

The Multiplexing System limits continuous starting system operation to 14 seconds; the starter circuit is then disconnected for 60 seconds to allow the starting system to cool down.
Stop Engine Override Switch

Apply the Stop Engine Override switch only for emergencies, such as moving the vehicle from traffic to a safe stopping area. The override interval is 30 seconds. Repeat the switch cycle to activate a repeat override sequence, if necessary.

The Stop Engine Override toggle switch is used to override the engine shutdown system in an emergency. The switch also prompts the engine diagnostics system to flash codes on the Check Engine indicator located on the instrument panel. Refer to the Vehicle Operation Section of this manual for further information.

Idle Speed Switch

Excessive engine idling is not recommended by the engine manufacturer. Operate engine at fast idle speed if idling for periods longer than 10 minutes. Consult your local transit authority for operating policy.

The Idle Speed toggle switch activates the preset fast idle to increase the engine RPM to maintain optimum engine operating temperature during periods of extended idling. Activating the fast idle following a cold engine start also allows quicker engine warm-up.

NOTE:

The FAST position on the Idle Speed switch only operates if the engine is running, the transmission shift selector is in the neutral [N] position and the parking brake is applied.

Night Light Switch

The Night Light toggle switch controls power to the interior fluorescent light panels that are operational when the Aisle Lights switch is in the ON or NORMAL position. Positioning the Night Light toggle switch to A Group, illuminates the light panels. Positioning the switch to B Group extinguishes the lights.
Aisle Lights Switch

The following table displays the lights that will be illuminated based on the positions of the Aisle Lights switch and Master Run switch. See “Figure 25: Interior Lighting Panels” on page 73.

<table>
<thead>
<tr>
<th>AISLE LIGHTS SWITCH POSITION</th>

</tr>
<tr>
<td>OFF</td>
<td>ANY POSITION</td>
<td>A,B</td>
<td>Streetside (None) Curbside (None)</td>
</tr>
</tbody>
</table>

Note 1: Aisle lights will automatically shut off after 10 minutes.
Sweeper Light Switch

The Sweeper Light toggle is used to provide interior lighting for cleaning personnel when the vehicle is shut down and the Master Run switch is in the STOP-ENGINE position. Briefly hold the momentary toggle switch in the HOLD position, then release. The lights are on a timer and will automatically shut off after 15 minutes.

Speaker Select Switch

The Speaker Select toggle switch controls the interior and exterior speakers of the public address (P.A.) system. Position this toggle switch to INTERIOR, EXTERIOR or BOTH to direct the P.A. announcement to the desired audience.
Hill Start Switch

The Hill Start switch is a momentary toggle switch that operates the vehicle’s brakes to prevent unwanted motion when starting on a hill. Position and hold the switch to ON to apply the brakes. Release the switch when the transmission system torque can move the vehicle in the desired direction.

Silent Alarm Switch

The Silent Alarm Switch is located on the panel of the side console adjacent to the driver’s seat cushion. Pressing the switch prompts the destination signs to display a distress message.

**NOTE:**

Disengaging the silent alarm requires stopping the vehicle and cycling the Master Run switch from a RUN position to STOP-ENGINE and back. The engine will require a restart.

Foot Operated Controls

See “Figure 26: Driver’s Foot Controls” on page 75.

Brake Treadle

The brake treadle, located to the left of the accelerator treadle, controls the application and release of the service brakes. The brake treadle also controls the retarder function. Refer to the Vehicle Operation Section of this manual for specific operating procedures on the retarder.

Brake application is proportional to the amount of treadle movement applied. Pressing the brake treadle illuminates the stop lights and the stop lights indicator.

Accelerator Treadle

The accelerator treadle, located to the right of the brake treadle, controls the engine throttle. Acceleration of the engine is proportional to the amount of treadle movement applied.
Headlight Dimmer Switch

The Headlight Dimmer switch is a heel-activated click-in switch located adjacent to the side console. Pressing the switch changes the headlight operating mode between either high beam or low beam. The blue high beam indicator on the instrument panel indicates the high beam mode.

Turn Signal Switches

Two bracket-mounted, momentary-on switches control the right and left turn signal lights when held depressed. Left or right turn signal indicators on the instrument panel illuminate when respective floor switch is activated.

![Figure 26: Driver's Foot Controls](s0357107a.wmf)

Miscellaneous Controls

See “Figure 27: Miscellaneous Switches” on page 77.

Door Master Switch

**WARNING**

Greater attention to passenger safety must be given whenever operating the vehicle with the Door Master switch in the OFF position, as this position disables several safety features and will allow the following conditions to occur:

- Vehicle can be moved with entrance and/or exit door open (brake interlocks disabled).
- Transmission can be shifted without foot on brake treadle.
- Transmission can be shifted and vehicle moved with wheelchair ramp deployed.
- Exit doors can be opened at any speed by using the emergency release control valve.

The Door Master toggle switch, located on the driver’s overhead panel, controls power to the brake interlocks and exit door. When the switch is in the ON position, the entrance and exit doors are fully functional. In this mode, opening the exit door, kneeling the vehicle or operating the wheelchair ramp engages the interlocks. Engaging the interlocks applies the rear brakes and deactivates the accelerator.

When the switch is in the OFF position, the brake interlocks are released (interlocks will not engage). The entrance door remains fully functional and the exit door does not function. A warning buzzer sounds and the Rear Door Open indicator illuminates on the instrument panel. In this mode, the exit door only opens if the emergency release control valve is activated. The control valve is located behind the breakable window to the left of the exit door.

**ABS Switch**

The ABS switch is located in the destination sign compartment and is used by service personnel to troubleshoot the ABS System. Pulling the switch to BLINK CODE and releasing activates the blink code diagnostic capabilities. The blink code sequence displays on the instrument panel ABS Fail indicator.
The Exhaust Filter switch, located in the destination sign compartment, is a 3-way toggle switch with NORMAL, INHIBIT and REGEN positions. This switch is used by service personnel as required to regenerate or burn soot off of the muffler filter. The function of the switch settings is as follows:

- **NORMAL** - this position is used for everyday vehicle operation. Regeneration will occur as needed while the vehicle is being driven.
- **INHIBIT** - this position is used when the vehicle is parked inside for servicing or any other situations where the regeneration process must be disabled for safety reasons.
- **REGEN** - this position is used by service personnel to initiate a forced regeneration when the vehicle is parked in a safe location. The engine speed and exhaust temperature will increase as the muffler filter regenerates.

**Entrance Door Manual Control Valve**

This air control valve is located beside the driver, just below the side console. Turning it to the OFF position releases the air controlling the entrance door. This allows manual operation of the door for initial vehicle entry. For normal entrance door operation, position the door manual control valve to ON.
10. VEHICLE OPERATION

Pre-Start Checks & Adjustments

A daily routine inspection of the vehicle should reveal any required repairs or adjustments. These need to be reported to service personnel to maintain the best operating condition of the vehicle. When it is ready for service perform the following steps upon entry.

- Activate the Multiplexing System by turning the Master Run switch to the DAY-RUN or NIGHT-RUN position.
- Adjust the driver's seat for individual comfort.
- Adjust the tilt/telescopic steering column to suit.
- Adjust all mirrors for unobstructed views.
- Check that the Door Master switch is in the ON position.
- Check horn operation.

Transmission Operation

CAUTION

In temperatures below -20°F (-29°C), set the Idle Speed switch on the side console to FAST to warm the transmission. Reset the switch to NORMAL before shifting from neutral [N], to reverse [R] or drive [D].

CAUTION

Be sure to bring the vehicle to a full stop before shifting from drive [D] to reverse [R] or vice versa.

WARNING

NEVER leave the driver’s seat while the transmission is in gear.

The push button shift selector is used to select the transmission operating ranges, display transmission oil level, and display diagnostic codes. The LED display panel uses two green alpha-numeric characters to display these functions. The operating range buttons include:
- [R] Reverse - press this button to select reverse. The LED display panel will show [RR].
- [N] Neutral - press this button to select neutral. The LED display panel will show [NN].
- [D] Drive - press this button to select drive. The LED display panel will show [DD].

**NOTE:**

*When the vehicle is operating in drive, the display panel will indicate the highest available range and the current operating range. Example: "52" would indicate 5 available forward speeds and operation is currently in the 2nd range.*

- (Up) Arrow - press this button when in drive [D] to request the next higher range. Continuously pressing the button will select the highest range available.
- (Down) Arrow - press this button when in drive [D] to request the next lower range. Continuously pressing the button will select the lowest range available.
- Mode - the mode button is used to view and toggle through diagnostic code information when the Diagnostic Code Display mode has been entered. The performance or economy mode feature is not available on this unit.

Operate the transmission using the following procedure:

1. Before starting the engine
   a. Check that the transmission is in neutral [N].
   b. Check that the parking brake is on.
   c. Apply the brake treadle.
2. With the engine running and idling at normal speed, apply firm pressure on the brake treadle and make the desired range selection.
3. Release parking brake and the brake treadle to proceed.
4. To change direction, bring the vehicle to a full stop, apply firm pressure on the brake treadle and make the desired range selection.

**NOTE:**

*A back-up alarm activates when selecting reverse [R].*

5. When parking or shutting down the vehicle come to a full stop, apply the parking brake, select neutral [N] and release the brake treadle.
6. To upshift or downshift the transmission, use the up or down arrow buttons respectively while in drive [D]. Pressing a button once changes the range by one. The second numeric character on the LED display will show the current operating range.
Retarder Operation

The retarder is used to slow the vehicle and works in conjunction with the service (air) brakes. The retarder, located inside the transmission, is a fluid brake that creates drive-line deceleration. When activated, its housing fills with transmission fluid which impedes rotor and output shaft rotation slowing the vehicle. Retarders improve vehicle economy by extending the service life of the brake linings.

The retarder is supplemental to the operation of the service brakes. Overall braking efficiency (service brakes plus retarder) is affected by vehicle speed, road conditions and condition of the vehicle brakes, tires and mechanical systems. Retarder operation decreases in effectiveness as the vehicle slows down. It is the responsibility of the driver to drive the vehicle in a safe and controlled manner at all times.

The retarder operates in three stages and is only effective at speeds above 5 mph. Releasing the accelerator engages the first stage of the retarder operation. Lightly pressing on the brake treadle (the first 5° to 10° of movement) engages the second stage of retarder operation. Further brake application engages the third stage leading to full retarder operation. Releasing the brake treadle will disengage the retarder. The retarder can be disabled using the Retarder switch located inside the destination sign compartment.

Hitting a bump or pothole may activate the ABS system. The retarder will automatically be turned off if the ABS system is in active operation (ABS event). When the ABS event deactivates, retarder operation will resume in approximately 6 seconds.

Retarder operation is attenuated and high gear is locked out if the transmission fluid becomes overheated. The retarder function is fully restored once the transmission fluid has cooled sufficiently or if the output shaft speed sensor detects a substantial increase in speed with the accelerator fully released (runaway vehicle).

%NOTE:%

Always be prepared to use the service brakes to stop the vehicle.
Anti-Lock Braking System

The Anti-Lock Braking System (ABS) functions to bring the vehicle to a safe, controlled stop during emergency braking situations. Through computer monitoring of wheel speeds the system controls brake pressure to prevent wheel lock-up. If during brake application the ABS system senses imminent wheel lock-up it engages automatically thus increasing vehicle stability and control. The ABS is inactive (no ABS event) whenever wheel deceleration difference remains within programmed limits.

An ABS Indicator on the instrument panel indicates any active faults and is also used by service personnel to retrieve codes.

![WARNING]

**WARNING**

Keep stopping distances the same as those for similar non-ABS equipped vehicles.

To operate under normal conditions use the standard braking technique. For emergency braking apply firm and constant pressure to the brake treadle. If required the ABS system will activate automatically producing a pulsing sensation to the brake treadle and a hissing sound. These are normal indications of ABS system operation. During emergency braking avoid “pumping” the brakes as this defeats the pulsing action of the ABS system and will increase your stopping distance.

**NOTE:**

*Under certain operating conditions, the ABS system will override the transmission retarder. Refer to “Retarder Operation” in this manual for specific operating conditions which apply.*

If the ABS on one wheel malfunctions the system will retain normal braking on that wheel. Should the entire ABS System malfunction the system will also retain normal braking. The ABS Fail indicator on the instrument panel will illuminate if a malfunction occurs.

**NOTE:**

*After ABS System service the ABS Fail indicator will remain illuminated at engine start-up. Driving the vehicle above 4 mph should extinguish the indicator. If the indicator remains illuminated, active faults are still present; contact service personnel.*
Starting the Engine

**WARNING**

Put the shift selector in neutral [N] and apply the parking brake before starting the engine. If the parking brake indicator does not illuminate, DO NOT OPERATE THE VEHICLE.

To operate the vehicle the Battery Disconnect switches must be in the ON position. Check the switches by opening the battery disconnect access door at the rear of the vehicle. These connect the vehicle electrical circuits to the battery power. See “Figure 28: Battery Disconnect Switch” on page 82.

**NOTE:**

Refer to the Driver’s Check List Section of this manual before operating the vehicle.

![Figure 28: Battery Disconnect Switch](op3442a.wmf)
Master Run Switch

Turn the Master Run switch (on side console) to DAY-RUN or NIGHT-RUN position. This activates the vehicle’s Multiplexing System. Illuminated indicator lights and sounding alarms signify an active Multiplexing System.

**NOTE:**

*When restarting less than 30 minutes after engine shut down, the Multiplexing System responds instantly.*

Start Push Button

**WARNING**

Put the shift selector in neutral [N] and apply the parking brake before starting the engine. If the parking brake indicator does not illuminate, **DO NOT OPERATE THE VEHICLE.**

With the vehicle’s Multiplexing System active, push and hold the Start push button until the engine starts. Release the push button as soon as the engine starts.

If the starter fails to operate, check the following:

- The Master Run switch is in the DAY-RUN or NIGHT-RUN position.
- The Transmission Selector indicator shows neutral [N].
- The engine compartment Engine Run switch is in the FRONT position.
- The parking brake is applied.

**NOTE:**

*The Multiplexing System limits continuous starter operation to 14 seconds; the starter circuit is then disconnected for 60 seconds to allow the starter to cool down.*
Operational Checks

Once the engine is operating the operator should observe the following:

- The air system pressure is between 105 and 125 psi (724 and 862 kPa) and the suspension is at full height. The Air System requires a working pressure of 105 to 120 psi (724 to 827 kPa).
- The No Gen indicator is off when the engine is operating.
- Shift selector neutral [N] indicator remains illuminated.
- Parking brake and stop light indicator remain illuminated as long as the parking brake is applied.
- Door controller is operational.
- Position the Door Master switch to the OFF position and attempt to open the exit door by using the side console door controller. The exit door should not be operational; the entrance door should remain operational.
- Return the Door Master switch to the ON position.
- Wiper and washer controls are operational.
- Defroster/heater controls (on dash) are operational.
- Exterior lights operate during exterior light test. To conduct test, ensure engine is running and parking brake is applied, then press both turn switches simultaneously. All exterior lights will illuminate for two minutes. The lights are extinguished by shifting the transmission out of neutral [N]. This feature enables one person to test the exterior light system.
- The destination sign controller is active.

Parking Brake

The parking brake indicator illuminates when the parking brake is applied. If the parking brake indicator is not illuminated, apply the parking brake by pulling up on the parking brake control valve knob. If the parking brake indicator does not illuminate, DO NOT OPERATE THE VEHICLE.

Press the brake treadle before releasing the parking brake. Release the parking brake by pulling up on the control knob. The parking brake indicator extinguishes.

NOTE:

Reapply parking brake.
Stop Lights

The stop lights indicator illuminates when the rear stop lights are on. If the indicator is not illuminated, check for rear stop light failure.

Low Air

The Low Air indicator illuminates to warn of an unsafe air system pressure level. A warning buzzer sounds when the Low Air indicator is activated. DO NOT OPERATE THE VEHICLE until the alarm system is canceled.

The air pressure gauge indicates the air system pressure levels of the air brake system. The air system will maintain pressure levels above the low operating limit of 105 psi (724 kPa) during normal vehicle operation.

Check Engine

The Check Engine indicator on the instrument panel illuminates momentarily before starting. The Check Engine indicator extinguishes before the engine starts. If the Check Engine indicator remains illuminated, DO NOT OPERATE THE VEHICLE.

Shift Selector Display

At engine start-up the shift selector’s display shows [N] to indicate that the transmission is in neutral. This should occur automatically at each engine start-up.

No Gen

When illuminated, the No Gen indicator signals that the alternator is NOT charging. The indicator remains illuminated until the engine starts. If the indicator fails to remain illuminated until the engine starts, DO NOT OPERATE THE VEHICLE.

Operator Display Keyboard (ODK) Messages

Check that the destination sign control unit correctly programs electronic destination sign messages.
Rear Door Open Indicator

Move the door controller to position #3, #4 or #5 to check that the Rear Door Open indicator illuminates when the doors open.

**NOTE:**

*Exit doors will open and the interlocks will be engaged.*

Turning the door controller handle to position #1 closes the entrance and exit doors and extinguishes the Rear Door Open indicator. Check that the exit doors are closed. If the exit doors are not closed and the Rear Door Open indicator is still illuminated, DO NOT OPERATE THE VEHICLE.

Day-Time Operation

When the engine is operating, check the following:

- The air system pressure is between 105 and 125 psi (724 and 862 kPa) and the suspension is at full height. The air system requires a working pressure of 105 to 120 psi (724 to 827 kPa).
- The No Gen indicator is off when the engine is operating.
- Shift selector neutral [N] indicator remains illuminated.
- Parking brake and stop light indicator remain illuminated as long as the parking brake is applied.
- Daytime running lights operation.
- Front, side and rear destination/route sign lights.
- Door controller operation.
- The Door Master switch, when placed in the OFF position, disables the exit door and inhibits the brake interlocks.
- Aisle lights operation.
- Return the Door Master switch to the ON position.
- Wiper and washer controls operation.
- Defroster/heater control (on dash) operation.
Night-Time Operation

For night-time operations, ensure the Master Run switch is placed in the NIGHT-RUN position. Check the following in addition to the day-time checks:

- Instrument panel illumination lights.
- Headlight operation (high and low beam).
- Front and rear identification and marker lights.
- Tail lights.
- License plate light.
- Panel lights dimmer changes the brightness of instrumentation backlights and panel text.
- Interior aisle lights can be turned on using the Aisle Lights switch.

Pre-Trip Brake Test

WARNING

Before driving the vehicle conduct the following test sequence. If the test reveals a fault, advise service personnel and DO NOT OPERATE THE VEHICLE.

Conduct the following test sequence to ensure that the air brake system is functioning properly.

1. Apply the parking brake.
2. Start the engine, set the Idle Speed switch to FAST and check the following:
   a. The low pressure warning devices switch off as the air pressure builds.
   b. If the air pressure gauge reading was below 90 psi (620 kPa), the reading increases back to 90 psi (620 kPa) in less than three minutes.
   c. The air pressure gauge reading levels off at 120 to 125 psi (827 to 862 kPa).
3. Release the parking brake.
4. Make multiple light brake treadle applications and check the following:
   a. The air pressure gauge reading stabilizes at 105 psi (724 kPa) as the air compressor begins its pumping cycle.
   b. After continued multiple light brake treadle applications the low pressure warning devices activate as the air pressure gauge reading falls to 75 psi (517 kPa).
5. Release the brake treadle and reapply the parking brake.
6. Allow the air system to fully recharge.
7. Stop the engine and proceed as follows.
   a. Release the parking brake.
   b. Apply the brake treadle fully, hold and check the following:
      • Upon treadle application the air pressure gauge reading does not drop more than 18 psi (124 kPa).

   ☞ **NOTE:**
   
   Tap the gauge to be sure the needle is not stuck.
   
   • The air pressure does not drop more than 3 psi (20 kPa) per minute.
   • There are no audible air leaks.
   c. Release the brake treadle and apply the parking brake.
8. Restart the engine.
   a. Set the Fast Idle switch to FAST to recharge the air system.
   b. When the reading levels off at 120 to 125 psi (827 to 862 kPa), switch off the fast idle.
   c. Release the parking brake.
9. Move the vehicle slowly and test brake response.
Moving the Vehicle

1. Fasten driver’s seat-belt.
2. Close the doors by turning the door controller handle to position #1. The Rear Door Open indicator should be off.
3. Apply the brake treadle and release the parking brake. The parking brake indicator extinguishes.
4. Shift the Transmission Selector into the desired gear.

☞ NOTE:

The neutral [N] indicator extinguishes and the appropriate range letter appears in the display.

5. Release the brake treadle and lightly apply the accelerator treadle to slowly move vehicle from the parking area. The stop lights indicator extinguishes.
6. Check the steering wheel for vibrations, looseness or binding while the vehicle is in motion. If any abnormalities are present, DO NOT OPERATE THE VEHICLE.
Parking the Vehicle

The parking brake must be applied when parking the vehicle. When parking downhill, be sure the front wheels are turned into the curb; when parking uphill, be sure the front wheels are turned away from the curb. See “Figure 29: Parking on an Incline” on page 90.

1. Bring the vehicle to a complete stop using the brake treadle. The stop lights indicator illuminates. Shift the transmission selector into neutral [N].
2. Apply the parking brake and release the brake treadle. The parking brake indicator illuminates.
3. Open the entrance door by placing the controller in position #2.
4. Turn the Master Run switch to the STOP-ENGINE position.
5. Exit the vehicle.
6. Manually close the doors.

Figure 29: Parking on an Incline
Roof Hatch Ventilation

The roof hatches may be used for ventilating the interior when the vehicle is in motion. Open the front roof hatch so that it draws air into the vehicle and open the rear hatch so that it draws air out of the vehicle. Push firmly on the front or rear hatch handle to tilt the roof hatch to the desired position. See “Figure 30: Roof Hatch Ventilation” on page 91.

CAUTION

Close the roof hatches when passing under low overhead restrictions.

NOTE:

DO NOT pull the red emergency release handle when opening the roof hatch in vent mode.

NOTE:

Close the roof hatches when the HVAC system is operation or to keep precipitation out.

Figure 30: Roof Hatch Ventilation
Jump Start Connection

Behind the battery access door is a jump start connector to supply power to the batteries when normal engine starting is not possible. It uses a quick connect assembly to ensure a safe and correct electrical connection to the battery poles.

NOTE:
Advise service personnel if starting difficulties occur.

Engine Protection System

CAUTION

If engine shutdown occurs, DO NOT attempt an engine restart unless absolutely necessary. Continuing engine operation without fault correction may result in engine damage.

The New Flyer vehicle is equipped with an automatic shut down system to prevent engine damage. If the Stop Engine indicator illuminates, the Engine Protection System initiates a power reduction cycle that lasts 30 seconds. After that time the engine will shut down.

NOTE:
Use the 30 seconds to remove the vehicle from traffic. Contact service personnel for further instructions.

Kneeling

The vehicle’s kneeling operations are controlled by the Kneel switch on the instrument panel. This switch is used to raise, hold, or lower the vehicle.

Kneeling Procedure

1. Bring the vehicle to a complete stop, put shift selector in neutral, apply the parking brake and set the door controller to Position #2 to open the entrance door. Kneeling will not be enabled if the door is closed.
NOTE:

Brake and accelerator interlocks engage when the entrance door is open and kneeling is in process.

WARNING

Prior to kneeling the vehicle, ensure that boarding passengers stand clear of the vehicle and no obstructions exist.

2. Lift the switch guard and hold the Kneel switch in the LOWER position until the vehicle is completely kneeled. Boarding passengers must stand clear and wait until the vehicle has lowered, before entering the vehicle.

3. Set the Kneel switch to the RAISE position and close the switch guard once passengers have safely boarded. The vehicle will raise automatically to its full ride height.

Kneeling Signal

An amber lamp located beside the entrance door indicates when the kneeling system is in operation. A warning beep also sounds.

Passenger Signal System

This passenger signal system is activated by the following devices:

- Stop request cord
- Luggage rack stanchion push button
- Wheelchair area push button
- Passenger seat stanchion push button

Activating the signal system causes the following to occur:

- Stop request sign illuminates. The sign extinguishes when the system is reset.
- Stop Request indicator on instrument panel remains illuminated until the system is reset.
- A chime sounds once when the passenger signal system is activated. A different tone sounds if the wheelchair passenger signal system is activated.
The system is cancelled (reset) and the lights are extinguished by:

- Opening the entrance door with the door controller.
- Opening the exit door, once enabled with the door controller.
- Pushing the Stop Request switch to CANCEL and releasing.

The stop request sign extinguishes when the entrance or exit doors are fully open.

**Stop Request Button**

Five stop request buttons are located on the streetside luggage rack stanchion and the curb-side passenger stanchion. Pressing a button activates the system.

**Wheelchair Stop Request Push Buttons**

Stop request push buttons are located under each longitudinal hinged seat in the wheelchair stations. Pushing a button activates the passenger signal system. A chime sounds a different tone to alert of a wheelchair passenger stop request.

**Entrance & Exit Door Lights**

The entrance and exit doorways are lit by header lights (above the door), step lights and curb lights. Moving the door controller to open a door activates these lights. The lights extinguish as the doors close.

☞ **NOTE:**

*The exit door curb lights extinguish after a five second delay.*
11. WHEELCHAIR SYSTEM

The wheelchair system consists of a wheelchair ramp and wheelchair restraint system.

Wheelchair Ramp

The New Flyer vehicle is equipped with a wheelchair ramp system to assist passengers in boarding and exiting the vehicle.

**WARNING**

Ensure the following conditions are met prior to operating the wheelchair ramp:

- Ensure passenger safety during the wheelchair ramp operations. Monitor the passenger’s position during the operation cycle.
- Loading or unloading the passengers must be performed in a flat, open area. DO NOT deploy the ramp where trees, telephone poles, fire hydrants, or similar obstacles may jeopardize passenger safety or damage the ramp.
- Be familiar with ramp functions and operation before operating the equipment.
- DO NOT conduct the “STOW” operation with a passenger on the lift.
- Passengers are to board the ramp only when it’s at ground level, and the ‘DEPLOY’ cycle is complete.

**CAUTION**

Release the switch after the ramp has passed the 90° position. This prevents the oil and pump from overheating.

The switch to control this feature is located on the instrument panel. The three positions of the switch enable the wheelchair ramp mechanism to perform the following operations: See “Figure 31: Wheelchair Ramp Operation” on page 96.
NOTE:
When the ramp is in STOW or DEPLOY, the brake interlocks are activated. The vehicle will not move until the ramp is fully stowed and the switch is in the FLOAT position.

DEPLOY
This position activates the ramp from the closed position to the open position.

FLOAT
This position shuts off power to the pump, allowing the ramp to free-fall to either the open or the closed position. Upon cycle completion, this becomes an off position.

STOW
This position is used to move the ramp from the open to the closed position.

NOTE:
When the wheelchair ramp is in motion, an audible alarm sounds, and the exterior lift warning light illuminates and flashes.

Figure 31: Wheelchair Ramp Operation
Deploying the Ramp

1. Bring the vehicle to a complete stop in a flat, unobstructed area, one to three feet from the curb. Check for obstructions and be certain that there is adequate clearance to deploy the ramp.

2. Apply the parking brake.

3. Place the shift selector in neutral [N].

4. Kneel vehicle if required.

NOTE:

Parking brake and stop light indicators on the instrument panel will illuminate.

5. Move the door controller to the door open position.

CAUTION

Make sure the area in which the ramp will DEPLOY is clear of people and any obstructions.

6. Move the Ramp toggle switch to DEPLOY.

7. After the ramp has passed the vertical 90° position, release the switch. The ramp continues to lower until it reaches the ground.
Raising the Ramp

**WARNING**

Check for obstructions and be sure that all passengers are at a safe distance. Keep objects and passengers off the lift platform during the STOW operation.

1. Once the passenger has boarded the vehicle safely and is clear of the ramp, move the toggle switch to the STOW position.

**NOTE:**

An audible alarm sounds when the ramp is moving.

2. Raise the vehicle from the kneeling position.
3. Close the entrance door.
4. Disengage the parking brake and proceed to the next stop.

Ramp Emergency Procedures

In case the wheelchair ramp power unit fails, the unit may be hand-operated by using a pull-up strap located on the ramp’s corner.
Wheelchair Restraint System

The forward seat positions are equipped with a Wheelchair Restraint System for security of handicapped passengers. For optimum passenger safety be sure to follow the operating procedures to complete all the necessary restraint system connections. See “Figure 32: Wheelchair Restraint System” on page 100.

CAUTION

The wheelchair wheel-lock is for use on large diameter steel wheels only. Use both rear red belts if not using the wheel-lock.

Operating Procedures

1. Move the flip-up seat cushion up to the lock position.
2. Pull the lock release lever to open the wheel lock.
3. Back the wheelchair’s rear wheel into the wheel-lock until it engages and set the wheelchair brake.
4. Locate the two tie-down belts under the wheelchair barrier and attach each belt to solid rear frame members of the wheelchair as follows:
   a. Pull tie-down belt release handle on the wheelchair barrier.
   b. Pull each tie-down belt to extend.
   c. Attach extended end of each tie-down belt to a solid rear frame member of the wheelchair.
   d. Move the release handle back into position to take up the belt slack.
   e. Check belts to ensure they are secure.
5. Attach the front wheelchair restraint belts as follows:
   a. Deploy the restraint arm assembly by pulling on the release levers and folding the arm down. Ensure that arm is locked into position.
   b. Press the retractor release button and pull the belts to extend.
   c. Attach the belt hooks around solid front frame members of the wheelchair.
   d. Press the retractor release button again to take up the belt slack.
   e. Turn the belt retractor knobs until tight.
6. Secure the passenger by extending the window side lap belt across to the aisle side clip and fasten. Extend the shoulder belt and attach over the stud on the lap belt clip.
7. Check the belt locks by pulling on each end to ensure they engage.

12. BIKE RACK SYSTEM

**WARNING**

Loading or unloading bike from the streetside endangers the passenger. **LOAD OR UNLOAD THE BIKE FROM THE CURBSIDE ONLY.**

The bike rack system allows the passenger to load and unload a bike without driver assistance. In the case of children under ten, however, have an adult assist in loading and unloading the bike.

Be sure to load and unload the bike from either the front of the rack or from the curbside.

**Loading Operation**

**CAUTION**

To ensure safe vehicle operation, **NEVER** load a bike onto the bike rack which will in any way obstruct the headlamps. **ALWAYS** verify that the headlamps are unobstructed whenever a bike has been loaded onto the bike rack.

1. Remove water bottles, pumps or other loose items from bike prior to loading.
2. Squeeze bike rack handle UP to release latch.
3. Fold down bike rack.
4. Lift bike onto rack, fitting wheels into proper wheel slots.
5. Raise the support arm over the front tire so that the hook rests at the highest point on the front wheel. Bike is now held firmly in place.

**Unloading Operation**

1. Unload from curb or from in front of vehicle.
2. Raise support arm off the tire.
3. Lift bike out of wheel slots and set down.
4. If there are no other bikes on the rack, lift it until the rack swings into the lock position against the vehicle.
13. NOTES
